

# D3XX for Linux 1.1.0

By Future Technology Devices International

Aug 15 2025

## Introduction

D3XX for Linux/OS-X is an userspace library implemented based on libusb, which provides D3XX compatible APIs on Linux. There are some differences in the implementation APIs for Windows and Linux, which are listed below the API matrix.

	Windows	Linux/OS-X
Asynchronous API	Required for high throughput since it's not a buffered design, to keep multiple URB requests in the queue	Not required. Library's internal threads will keep multiple URB requests in the queue.
Data loss	Host will hang when <b>FT_ReadPipe</b> read 8K but FIFO master only returns 1K and no more data's coming, abort procedure is required to recovery from hang but 1K data will be lost	Set <b>dwURBBufferSize</b> of <b>FT_SetTransferParams</b> to 1024 for this situation to avoid both data loss and hang issue
Notification	Use <b>FT_ReadPipe</b> to read exactly the same amount of data reported by notification	Use <b>FT_ReadPipeEx</b> with timeout to get any data length, set timeout to 0 to read from library buffer only

libftd3xx uses an unmodified version of libusb which is distributed under the terms of the LGPL.

## History

- 1.1.0
  - D3XX Driver Design Upgrade.
  - Added ZLP functionality.
  - Added API Usage Demo App.

- Performed code cleanup.
- 1.0.19
  - Fixed double free issue in ReadPipeAsync and WritePipeAsync APIs when calling libusb\_free\_transfer and libusb\_cancel\_transfer APIs.
  - Removed unrelated test files and README files.
- 1.0.18
  - Fixed ThreadSanitizer data race issue by modifying usbi\_mutex\_destroy() in threads\_posix.h to safely check and destroy the mutex, and ensuring the correct locking order in libusb\_submit\_transfer().
  - Fixed the data race issue in AbortRecovery functionalities (using streaming mode).
  - Fixed the assertion issue in pthread\_mutex\_lock, pthread\_mutex\_unlock, and pthread\_setspecific APIs.
- 1.0.17
  - Resolved the issue with the GetVIDPID function to correctly extract and return the VID and PID.
  - Fixed the I2C 16-bit register access functionality (FT\_I2CAccess) on ft602.h.
  - Updated the libusb version to 1.0.27.
- 1.0.16
  - Removed session write in the WritPipe.
  - Updated the Makefiles with updatded toolchain path.
- 1.0.15
  - Added Zero length packet functionality.
- 1.0.14
  - Fix for memory leak.
- 1.0.13
  - Fix for double free in AbortPipe. (libusb\_free\_transfer API is called when transfer callback is invoked)
  - Added tar file creation for MacOS libraries.
- 1.0.12
  - Fix for FT\_AbortPipe timing issue and crash ( removed libusb\_free\_transfer from FT\_AbortPipe API)
  - Fix for Multi-channel support.
- 1.0.11
  - libusb1.0.26 update for MacOS.
- 1.0.10
  - Fix for FT\_GetOverlappedResult() API.
  - Removed unuse code.
- 1.0.9
  - Removed resubmission of transfer buffer in call-back.
- 1.0.8
  - Fix for limit of 8 overlap buffers. (Modified libusb\_transfer buffer allocation in write and read async functionalities).
  - Updated the libusb version to 1.0.26

- 1.0.7
  - Improved the Abort functionality and added Abort recovery Sample code.
  - Improved the Write Async functionality.
- 1.0.6
  - FT602 Support added for ARMv8 and ARMv7-32.
- 1.0.5
  - Fix for the issue with data read in the Notification call back function.
- 1.0.4
  - Support FT\_SetNotificationCallback() API.
  - Support FT\_ClearNotificationCallback() API.
- 1.0.3
  - Fix the small packet issue with FT\_ReadPipeEx API
- 1.0.2
  - Fix for the issue with data read in 1.0.1. There were some additional data coming in.
- 1.0.1
  - Fix issue in Async transfer.
- 1.0.0
  - New Driver
  - Removed read and write buffering at the library level.
  - New API's supported.
    - \* FT\_GetOverlappedResult()
    - \* FT\_InitializeOverlapped()
    - \* FT\_ReleaseOverlapped()
    - \* FT\_SetStreamPipe()
    - \* FT\_ClearStreamPipe()
    - \* FT\_AbortPipe()
    - \* FT\_ReadPipeAsync()
    - \* FT\_WritePipeAsync()
  - Bug fix: FT\_SetChipConfiguration() API NULL pointer issue.
  - Support for ARMv6 (hard float) is enabled.
- 0.6.5
  - Bug fix: Fix the read issue for macOS.
- 0.6.4
  - Bug fix: FT\_GetDeviceDescriptor() API failure.
  - Support FT\_GetInterfaceDescriptor() API.
  - Support FT\_GetPipeInformation() API.
- 0.6.3.1
  - Fix Serial number field length mismatch
- 0.6.3
  - Add in location ID (locID) for D3XX devices. Based on the bus number and the device address.
- 0.5.28
  - Fix for i686 wrap\_memcpy issue.
- 0.5.25

- Support for ARM Linux Build.
- 0.5.21
  - Bug fix: Ignore failure of update U1 for Revision A device
- 0.5.20
  - Limit maximum URB size to 16KB if Linux kernel version  $\leq 3.3$
  - Move workaround for FT600/FT601 Revision A chip from sample code into library
  - Start IN streaming after `FT_ReadPipe()`/`FT_ReadPipeEx()` has been called
- 0.5.17
  - Compiled with Ubuntu 14.04 (GCC 4.8.4) to support SUSE Linux Enterprise Server 11 SP4
  - For static link build, please use Ubuntu 14.04
- 0.5.6
  - Cross compiled with Android NDK R15, targeted to Android 6.0 API level 23
  - Static link to LLVM libc++ runtime
- 0.5.3
  - Compile with GCC 4.9.2, GLIBC 2.19
  - Bug fix: Fix potential session not auto repeated issue
  - API: `FT_GetDeviceInfoList()` will not longer open device if `pftHandle` is not NULL, which follows Windows Library's implementation
  - API: Filling correct value in `pullLengthTransferred` of `FT_ControlTransfer()`
- 0.5.0
  - Add Rev B chip support
- 0.4.11
  - Bug fix: `FT_ReadGPIO()` returns wrong value for Rev A chip
  - Bug fix: Change return value to `FT_OK` when `FT_ReadPipe()` and `FT_ReadPipeEx()`'s return value is `FT_TIMEOUT` and at least 1 byte had been read
- 0.4.10
  - API: implemented `FT_EnableGPIO()` `FT_WriteGPIO()` `FT_ReadGPIO()` for Revision A device
  - API: implemented `FT_GetDescriptor()` `FT_GetStringDescriptor()` `FT_GetDeviceDescriptor()` `FT_GetConfigurationDescriptor()` `FT_GetInterfaceDescriptor()` `FT_GetPipeInformation()` `FT_ListDevices()`
- 0.4.9
  - Support Revision B device: request device send ZLP before `FT_ReadPipe()`/`FT_ReadPipeEx()` timeouts
- 0.4.8
  - Bug fix: multiple channel read/write not working correctly
  - Remove `FT_AddVIDPID()` API, stop detecting D3XX devices by using VID/PID anymore
- 0.4.7

- Allow NULL parameters for FT\_GetDeviceInfoDetail()
- 0.4.6
  - Stop changing chip configuration in FT\_Create(), please remove ENABLENOTIFICATIONMESSAGE\_INCHALL and set DISABLE-CANCELSESSIONUNDERRUN in your application
  - Bug fix: read buffer pointer is not increased which cause data not been copied.
  - New demo application: file\_transfer.cpp which use FT245 loopback to duplicate file.
- 0.4.5
  - Add workaround for FT600/FT601 Rev.A device to prevent sending control requests when streaming is on, which may cause system hang or failed to create device.
- 0.4.4
  - Demo application: add new argument to change FIFO mode.
  - API: implemented FT\_EnableGPIO() FT\_WriteGPIO() FT\_ReadGPIO() FT\_SetGPIOPull() for Revision B device.
- 0.4.3
  - First beta release

## Installation

```
sudo rm /usr/lib/libftd3xx.so
sudo cp ftd3xx.h /usr/local/include
sudo cp Types.h /usr/local/include
sudo cp libftd3xx.so /usr/lib/
sudo cp libftd3xx.so. /usr/lib/
sudo cp 51-ftd3xx.rules /etc/udev/rules.d/
sudo udevadm control --reload-rules
sudo ldconfig
```

## Demo application

1. Extract the release package, compile the demo application.

`make`

2. Streamer application usage:
  - Arguments: `./streamer <read channel count> <write channel count> [mode]`
    - Mode: 0 = FT245 mode (default), 1 = FT600 mode
  - Examples:
    - FT245 loopback FPGA: `./streamer 1 1`
    - FT600 loopback FPGA: `./streamer 4 4 1`
    - FT245 streaming FPGA (read only): `./streamer 1 0`
    - FT245 streaming FPGA (write only): `./streamer 0 1`
    - FT245 streaming FPGA (read and write): `./streamer 1 1`

- FT600 streaming FPGA (3 channel read 1 channel write):  
`./streamer 3 1 1`
- Please run with root permission if streamer app failed to detect any device.
- Alternatively you can run the streamer application without installing library: `sh sudo LD_LIBRARY_PATH=. ./streamer 1 0`
- 3. File transfer loopback application usage:
  - Arguments: `./file_transfer <src file> <dest files> <FIFO mode/channel count> [loop]`
    - FIFO mode/channel count: 0 = FT245 fifo mode, 1 - 4 FT600 channel count
    - loop: 0 = oneshot (default), 1 = loop forever

## Demo application for Android

1. Install CMake and NDK from Android SDK Manager
2. Extract the release package, open `android-build` with your preferred text editor, the content of the file looks like below: `#!/bin/bash  
ASDK=/usr/local/opt/android-sdk ANDROID_API_LEVEL=android-23  
TMP_DIR=/tmp/d3xx-demo ARCHS=(arm64-v8a armeabi-v7a armeabi  
x86_64 x86) # Set to OFF if dynamic link is preferred  
STATIC_LINK_TO_D3XX=ON`
3. Change ASDK to point to the path of your Android SDK
4. Compile the demo application

`./android-build`

4. Run the compiled application on your Android target

```
adb push streamer /data/local/tmp
adb push libftd3xx.so /data/local/tmp
adb shell
su
cd /data/local/tmp
LD_LIBRARY_PATH=. ./streamer 1 1
```

## Static link

1. GCC 4.9 or later must be used
2. Link with GCC 4.9.2 C++ static library is required:

`LIBS = -L . -lftd3xx-static -llibstdc++-static`

## D3XX API matrix

API	Linux	Win	Remark for Linux
FT_CreateDeviceInfoList <sup>1</sup>		I	

API	Linux	Win	Remark for Linux
FT_GetDeviceInfoList	I	I	
FT_GetDeviceInfoDetail	I	I	
FT_ListDevices	I	I	
FT_Create	I	I	
FT_Close	I	I	
FT_WritePipe	I	I	pOverlapped parameter is not supported, internally will call FT_WritePipeEx with timeout option from FT_SetPipeTimeout, default timeout is 1second
FT_ReadPipe	I	I	pOverlapped parameter is not supported, internally will call FT_ReadPipeEx with timeout option from FT_SetPipeTimeout, default timeout is 1second
FT_GetOverlappedResult	I	I	
FT_InitializeOverlapped	I	I	
FT_ReleaseOverlapped	I	I	
FT_SetStreamPipe	I	I	
FT_ClearStreamPipe	I	I	
FT_AbortPipe	I	I	
FT_FlushPipe	I	I	
FT_GetDeviceDescriptor	I	I	
FT_GetConfigurationDescriptor	I	I	Active configuration only
FT_GetInterfaceDescriptor	I	I	Active configuration only
FT_GetStringDescriptor	I	I	
FT_GetPipeInformation	I	I	
FT_GetDescriptor	I	I	
FT_ControlTransfer	I	I	
FT_GetVIDPID	I	I	
FT_SetGPIO	X	I	Obsoleted
FT_GetGPIO	X	I	Obsoleted
FT_EnableGPIO	I	I	
FT_WriteGPIO	I	I	
FT_ReadGPIO	I	I	
FT_SetGPIOPull	I	X	For Rev. B device only
FT_SetNotificationCallback	I	I	
FT_ClearNotificationCallback	I	I	
FT_GetChipConfiguration	I	I	
FT_SetChipConfiguration	I	I	
FT_IsDevicePath	X	I	Linux doesn't support GUID path
FT_GetDriverVersion	I	I	
FT_GetLibraryVersion	I	I	
FT_GetFirmwareVersion	I	I	

API	Linux	Win	Remark for Linux
FT_ResetDevicePort	I	I	
FT_CycleDevicePort	X	I	
FT_SetPipeTimeout	I	I	Added to keep compatible with D3XX for Windows 1.2.0.5 RC6. Set 0 to read from /write to library buffer only
FT_SetTransferParams	I	X	Must be called before <b>FT_Create</b> is called
FT_ReadPipeEx	I	X	equivalent to <b>FT_SetPipeTimeout</b> + <b>FT_ReadPipe</b> . Use FIFO index instead of endpoint to address pipe
FT_WritePipeEx	I	X	equivalent to <b>FT_SetPipeTimeout</b> + <b>FT_WritePipe</b> . Use FIFO index instead of endpoint to address pipe
FT_ReadPipeAsync	I	X	Reads data from the pipe. An enhanced version of <b>FT_ReadPipeEx</b> for improved latencies between reads. However to get the maximum benefit, this API should be used asynchronously with <b>FT_SetStreamPipe</b> .
FT_WritePipeAsync	I	X	Writes data to the pipe. <b>FT_WritePipeAsync</b> used for asynchronous transfers with <b>FT_SetStreamPipe</b> . However the maximum input buffer size supported for this API is 1 Mega Byte to guarantee the lower latencies.

## New Linux only APIs

```
enum FT_GPIO_PULL {
    GPIO_PULL_50K_PD,
    GPIO_PULL_HIZ,
    GPIO_PULL_50K_PU,
    GPIO_PULL_DEFAULT = GPIO_PULL_50K_PD
};

enum FT_PIPE_DIRECTION {
    FT_PIPE_DIR_IN,
    FT_PIPE_DIR_OUT,
    FT_PIPE_DIR_COUNT,
};
```

---

<sup>1</sup>Implemented #[^X]: Non-exists

```

struct FT_PIPE_TRANSFER_CONF {
    /* set to true PIPE is not used, default set to FALSE */
    BOOL fPipeNotUsed;

    /* Enable non thread safe transfer to increase throughput, set this flag
     * if guarantee only single thread access the pipe at a time, default
     * set to FALSE */
    BOOL fNonThreadSafeTransfer;

    /* Concurrent URB request number, 8 by default, set value < 2 to use
     * default value */
    BYTE bURBCount;

    /* 256 by default, set value < 2 to use default value */
    WORD wURBBufferCount;

    /* 32K by default, set value < 512 to use default value */
    DWORD dwURBBufferSize;

    /* 1G by default, used by FT600 and FT601 only, set 0 to use
     * default value */
    DWORD dwStreamingSize;
};

typedef struct _FT_TRANSFER_CONF {
    /* structure size: sizeof(FT_TRANSFER_CONF) */
    WORD wStructSize;

    ULONG ulBufferLength,
    PULONG pulBytesTransferred,
    DWORD dwTimeoutInMs);

/* WritePipe with timeout
 *
 * dwFifoID: FIFO interface ID. Valid values are 0-3 which represents
 *           FIFO channel 1-4 for FT600 and FT601
 * dwTimeoutInMs: timeout in milliseconds, 0 means return immediately
 *               if no data */
FTD3XX_API FT_STATUS FT_WritePipeEx(
    FT_HANDLE ftHandle,
    UCHAR ucFifoID,
    PUCCHAR pucBuffer,
    ULONG ulBufferLength,
    PULONG pulBytesTransferred,
    DWORD dwTimeoutInMs);

/* Enable GPIOs
 * Each bit represents one GPIO setting, GPIO0-GPIO2 from LSB to MSB
 *
 * dwMask: set bit to 0 to skip the GPIO, 1 to enable the GPIO
 * dwDirection: set bit to 0 for input, 1 for output */

```

```

FTD3XX_API FT_STATUS FT_EnableGPIO(
    FT_HANDLE ftHandle,
    DWORD dwMask,
    DWORD dwDirection
);

/* Set GPIO level
 * Each bit represents one GPIO setting, GPIO0-GPIO2 from LSB to MSB
 *
 * dwMask: set bit to 0 to skip the GPIO, 1 to enable the GPIO
 * dwDirection: set bit to 0 for low, 1 for high */
FTD3XX_API FT_STATUS FT_WriteGPIO(
    FT_HANDLE ftHandle,
    DWORD dwMask,
    DWORD dwLevel
);

/* Get level of all GPIOs
 * Each bit represents one GPIO setting, GPIO0-GPIO2, RD_N, OE_N from
 * LSB to MSB */
FTD3XX_API FT_STATUS FT_ReadGPIO(
    FT_HANDLE ftHandle,
    DWORD *pdwData
);

/* Set GPIO internal pull resistors
 * dwMask: Each bit represents one GPIO setting, GPIO0-GPIO2 from
 * LSB to MSB
 * dwPull: Each two bits represents one GPIO setting, GPIO0-GPIO2 from
 * LSB to MSB
 *
 * dwMask: set bit to 0 to skip the GPIO, 1 to enable the GPIO
 * dwPull: refer to enum FT_GPIO_PULL */
FTD3XX_API FT_STATUS FT_SetGPIOPull(
    FT_HANDLE ftHandle,
    DWORD dwMask,
    DWORD dwPull
);

```

## Notes

1. Kernel 3.3 and older limitations
  - Maximum URB size cannot be larger than 16384 bytes
  - Kernel may not be able to allocate more than 60 of concurrent URB requests, please refer to kernel source

The following code example shows how to cope with the limits,

```
static void old_kernel_workaround(void)
{
    FT_TRANSFER_CONF conf;

    memset(&conf, 0, sizeof(FT_TRANSFER_CONF));
    conf.wStructSize = sizeof(FT_TRANSFER_CONF);
    conf.pipe[FT_PIPE_DIR_IN].bURBCount = 7;
    conf.pipe[FT_PIPE_DIR_OUT].bURBCount = 7;
    conf.pipe[FT_PIPE_DIR_IN].dwURBBufferSize = 16384;
    conf.pipe[FT_PIPE_DIR_OUT].dwURBBufferSize = 16384;
    for (DWORD i = 0; i < 4; i++)
        FT_SetTransferParams(&conf, i);
}
```

2. Please call `FT_CreateDeviceInfoList` again after `FT_ResetDevicePort` is been called, because the device is disconnected after port reset.

```
FT_ResetDevicePort(handle);
FT_Close(handle);
FT_CreateDeviceInfoList(&count);
```

3. Rev.A chip failed to get 1K aligned data issue

When FIFO master's last write is 1K aligned data, and master stop writing after this, part of the 1K aligned data may stuck in the host URB buffer, and application will not be able to receive it, until fifo master start to write again.

If your application hits this special case, please set `dwURBBufferSize` of `FT_SetTransferParams` to 1024 for USB 3.0 port, and 512 for USB 2.0 port. This will make sure host URB requests return at the aligned boundary but leads to poor performance.

Throughput is around 165MiB/s for single channel read configuration when set to 1K, 362MiB/s when set to 32K.

4. Endpoint/Pipe ID vs FIFO ID

Endpoint or Pipe ID is used for `FT_ReadPipe()` and `FT_WritePipe()`. FT600/601 has 4 channels, the endpoint number is 0x2-0x5 for OUT pipes, and 0x82-0x85 for IN pipes.

FIFO ID is used for new APIs e.g. `FT_SetTransferParams()`, `FT_ReadPipeEx()`, `FT_WritePipeEx()`, `FT_ReadPipeAsync()` and `FT_WritePipeAsync()`, which is [0, 3] for FT600/FT601.
